CC surface of endothelial cells that line the interior wall of capillaries. CC surface of endothelial cells that line the interior wall of capillaries. CC VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or CC VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or CC VCAM-1 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows CC white blood cells to adhere to the capillary wall in areas where the CL tissue surrounding the capillary has been infected or damaged. Sometimes CC this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. CC Cpds. capable of blocking this process may be beneficial as therapeutic agents. IA4B1 also recognises the extracellular matrix glycoprotein competis. IA4B1 also recognises the extracellular matrix glycoprotein competises in the fibronectin. One site is found in the Hepli region and is expressed in all isoforms; two others (CS1 and CS5) are present in the CC alternatively spliced type III connecting segments. CS1 has the higher CC affinity for IA4B1 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CS1 capptide that include the LDV domain presented in such a way by its novel competities and contains the cripeptide LDV as its minimal active appride that include the LDV domain presented in such a way by its novel contains sequence to produce a potent inhibitor of IA4B1 binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tissue damage; injury; fibronectin; extracellular matrix glycoprotein; CS1; CS5; H1; LDV; active site.

The peptides are capable of binding to cell adhesion molecules and are used in aqueous irrigation solutions for use during and after endoscopic operations. Preferred irrigation solutions are electrolyte-free and contain 1 microg/ml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RCD, LDV, LDA, DGEA, GPRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The

                                                                                       The present sequence is a linear stretch of amino acids (present in fibronectin) recognised by the integrin alpha/betal. Integrins are cell surface receptors. The penton base protein (one of the coat proteins) of adenoviruses binds to integrins. The integrins not only provide a binding site for the adenoviral penton base protein, but also mediate cellular adhesion to the extracellular matrix molecules. The specification describes a method of introducing an adenovirus into a cell in vitro having a particular cell surface binding site. The adenovirus is contacted with a bispecific molecule comprising a component that selectively binds a binding domain of the penton base protein of the adenovirus and a second component that selectively binds the cell surface binding site. A complex of the adenovirus and the cell is contacted with it to allow entry of the adenovirus into the cell. The methods can be used for research and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fibrinogen from glycoprotein IIb-IIIa. This dissociation is caused by the binding of an integrin-ligand dissociator at ligand binding site I of glycoprotein IIb-IIIa. The invention provides a method of disaggregating an existing platelet thrombus in a blood vessel, where the platelet

metalloprofease inhibitors. The peptides AAY80466-Y80492 are claimed examples of cell adhesion peptides used in the system of the invention. The system is used to replace, remodel or correct bone defects, e.g. fractures or bone mass loss. Incorporation of (I) into the scaffold results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the rate-determining step of extracellular matrix formation. The scaffold can be designed to have a predetermined resorption/degradation rate, and may include regulatory compounds for specific cell types.
                                                                                                                                                                                                                                               bone formation and a component that decreases bone resorption (II). (II) induces migration and adhesion of osteoblasts and osteoclasts and (II) inhibits proteolysis (specifically by plasmin) of extracellular matrix. (I) is preferably selected from: selectin or selectin binding fragments, proteins and peptides that facilitate cell adhesion, plasminogen activator inhibitors, protease inhibitors and plasminogen activator inhibitors, protease inhibitors and plasminogen activator inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          System for reconstructing osseous tissue, useful e.g. for fractures, comprises scaffold containing promoter of bone inhibitor of bone resorption \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 14; Page 32; 44pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3465
                                                                                                                                                                                                                                                                                                                    very late antigen; antibody; kidney disease; chronic renal failure; end-stage renal disease; chronic diabetic nephropathy; diabetic glomerulopathy; diabetic renal hypertrophy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  inducible cell surface protein VCAM-1 (vascular cell adhesion molecule-1) and for the alternatively spliced forms of fibromectin (FN) which contain the CS-1 domain. The novel compounds inhibit cell adhesion, and consequent or associated pathogenic processes mediated by VLA-4, and may therefore be useful in the treatment and prevention of inflammatory, autoimmune, or respiratory disorders. These include asthma, arthritis, psoriasis, multiple sclerosis, transplant rejection, diabetes, and inflammatory bowel disease. Sequences AAY69618-Y69620 represent peptides derived from the VLA-4-binding domain of the FN CS-1 region which contain the LDV motif and are known to inhibit fibronectin-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel arylalkyl and arylureidoalkyl azolylalkanolc acid derivatives and related compounds (I), and their salts and prodrugs. These are are integrin inhibitors, specifically of VIA-4 (very late antigen 4, also known as alpha-4-beta-1 or CD49d/CD29), which mediate cell adhesion. VIA-4 is a receptor for the cytokine-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB91966
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      alpha-4-subunit containing integrins or antagonists of alpha-1-subunit-containing integrins. In particular, the antagonists are antibodies specific for VLA-1 (very late antigen-1, alpha-1-beta-1 integrin) or VLA-4 (alpha-4-beta-1 integrin) which inhibit the interaction of the integrin and its cognate ligand (collagen I, collagen IV, and laminin in the case of VLA-1, and fibronectin and VCAM-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal failure, end-stage renal disease, chronic diabetic nephropathy, diabetic glomerulopathy, diabetic renal hypertrensive nephrosclerosis, chronic glomerulonephritis, hereditary nephritis or renal dysplasia. Sequences AAB7346-represent peptides derived from the VLA-4 binding domain (CS-1 region) of fibronectin, which inhibit fibronectin-dependent cell adhesion, and may therefore be used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating failure,

The present invention relates to a peptide with a series of heptad-repeats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad repeats. The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding party
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     clustered transmembrane protein having the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying agents as inhibitors of alpha4 integrin biological responses by contacting the structural model with paxillin or a paxillin related molecule in the presence and absence of a test agent and determining binding of paxillin or paxillin related molecule to the structural model. A decrease in binding in the presence of the test agent indicates that the test agent is an inhibitor of alpha4 integrin biological response. Inhibitors of the binding of paxillin to alpha4 are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                heptad repeats. At least a portion of the polypeptide is prepared recombinantly or at least 1 heptad repeat in the series has a diffamino acid sequence to other heptad repeats in the series. The
                                                                                                                                                                                                                                                                                                  Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to the repeats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ginsberg MH,

                                                                                                                    Submitted (AUG-1994) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: PRODUCES ATP FROM ADP IN THE PRESENCE OF A PROTON GRADIENT ACROSS THE MEMBRANE. THE GAMAA CHAIN IS BELIEVED TO BE IMPORTANT IN REGULATING ATPASE ACTIVITY AND THE FLOW OF PROTONS THROUGH THE CF(0) COMPLEX.

-!- SUBUNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE SUBUNITS: ALPHA(3), BETA(3), GAMMA(1), DELTA(1), EPSILON(1). CF(1) HAS THREE MAIN SUBUNITS: A, B AND C.

-!- SIMILARITY: BELONGS TO THE ATPASE GAMMA CHAIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bacteria; Firmicutes; B

Biochim. Blophys. Acta 93::141-155(1988).

-1. FUNCTION: PRODUCES ATP FROM ADP IN THE PRESENCE OF A PROTON GRADIENT ACROSS THE MEMBRANE. THE GAMMA CHAIN IS BELIEVED TO BE IMPORTANT IN REGULATING ATPASE ACTIVITY AND THE FLOW OF PROTONS THROUGH THE CF(0) COMPLEX.

-1. SUBUNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE COMPONENTS. ALPHAGA: PROTON CHANNEL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-FEB-1995 (Rel.

SUBMÎTUKA (AUG-1994) TO THE EMBL/GENBANK/DDBJ dATABASES.

-I- FUNCTION: PRODUCES ATP FROM ADP IN THE PRESENCE OF A PROTON

GRADIENT ACROSS THE MEMBRANE. THE GAMMA CHAIN IS BELIEVED TO BE

IMPORTANT IN REGULATING ATPASE ACTIVITY AND THE FLOW OF PROTONS

THROUGH THE CF(0) COMPLEX.

-I- SUBUNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC

CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE

SUBUNITS: ALPHA(3), BETA(3), GAMMA(1), DELTA(1), EPSILON(1). CF(0)

HAS THREE MAIN SUBUNITS: A, B AND C.

CHAIN FORTY. BELLINGS OF THE FRANCE CHAIN EDULY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ATPG_BAG

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

VCAM-1 recognises and binds to the integrin alpha-beta-1 (IAAB1; or VLA-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cpds. capable of blocking this process may be beneficial as therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              agents. IA4B1 also recognises the extracellular matrix glycoprotein fibronectin. Three distinct IA4B1-binding sites have been identified within fibronectin. One site is found in the HeplI region and is expressed in all isoforms; two others (CS1 and CS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher affinity for IA4B1 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CS1 peptide that include the LDV domain presented in such a way by its novel flanking sequence to produce a potent inhibitor of IA4B1 binding.

The present sequence is a linear stretch of amino acids (present in fibronectin) recognised by the integrin alpha/betal. Integrins are cell surface receptors. The penton base protein (one of the coat proteins) of adenoviruses binds to integrins. The integrins not only provide a binding site for the adenoviral penton base protein, but also mediate cellular adhesion to the extracellular matrix molecules. The specification describes a method of introducing an adenovirus into a cell in vitro having a particular cell surface binding site. The adenovirus is contacted with a bispecific molecule comprising a component that selectively binds a binding domain of the penton base protein of the adenovirus and a second component that selectively binds the cell surface binding site. A complex of the adenovirus and the bispecific molecule is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              penton base protein; coat proteins; adenovirus; binding site; cellular adhesion; extracellular matrix molecule; binding domicell surface binding site; bispecific molecule; binding domicell surface binding site; bispecific molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              endoscopic operations. Preferred irrigation solutions are electrolyte-free and contain 1 microg/ml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RGD, LDV, IDA, DGEA, GPRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The peptides protect against recurrence of tumours.

CC an existing platelet thrombus in a blood vessel is due to dissociation of the binding of an integrin-ligand dissociator at ligand binding site I of the binding of an integrin-ligand dissociator at ligand binding site I of the glycoprotein IIb-IIIa. The invention provides a method of disaggregating an existing platelet thrombus in a blood vessel, where the platelet thrombus may form an occlusion of a blood vessel, where the platelet thrombus may form an occlusion of a blood vessel, in a subject comprises administering a compound which dissociates fibrinogen bound to a first is the on platelet glycoprotein IIb-IIIa, by binding to a second interacting site on platelet glycoprotein IIb-IIIa, disaggregating the platelet thrombus. The method is used to treat humans with unstable considered to enact de-adhesion of osteoclasts from the bone surface to halt be used to enact de-adhesion of fosteoclasts from the bone surface to halt compathy, psoriasis. The methods can also be used to retinopathy, psoriasis. The methods can also be used to treat tumours, inflammatory conditions, e.g. arthritis, inflammatory conditions, e.g. arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The methods can be used for research and the vectors can be used for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disaggregating a ligand:integrin receptor complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Integrin-ligand; dissociator; disaggregation; platelet thrombus; stroke; fibrinogen; glycoprotein IIb-IIIa; angina; myocardial infarction; bone; osteoclast; osteoporosis; angiogenesis; cancer; diabetic retinopathy; psoriasis; tumour; atheroscierosis; inflammatory bowel disease; asthma; organ transplant rejection; arthritis; ILD.

                       fragments, proteins and peptides that facilitate cell adhesion, plasminogen activator inhibitors, protease inhibitors and metalloprotease inhibitors. The peptides AAY80466-Y80492 are claimed examples of cell adhesion peptides used in the system of the invention. The system is used to replace, remodel or correct bone defects, e.g. fractures, fissures or bone mass loss. Incorporation of (I) into the scaffold results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the rate-determining step of extracellular matrix formation. The scaffold cabe designed to have a predetermined resorption/degradation rate, and may include regulatory compounds for specific cell types.
                                                                                                                                                                                                                                                                      The invention relates to a novel system for reconstitution of osseous tissue comprising a scaffold carrying a compound (I) that promotes
                                                                                                                                                                                                                                                                                                                    Claim 14;
                                                                                                                                                                                                                                                                                                                                                 System for reconstructing osseous tissue, useful e.g. for fractures, comprises scaffold containing promoter of bone inhibitor of bone resorption \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              24-ЈИЦ-1998;
